Customer Problem Statement

Retail companies and consumer goods businesses continuously aim to maximize sales through effective product placement strategies such as endcaps, aisles, and shelves. However, in many organizations, sales and placement data are stored in raw spreadsheets or scattered reports without proper analytical visualization. This creates several real-world challenges. Marketing and retail teams find it difficult to clearly understand which product positions generate higher sales. Decision-making often relies on assumptions rather than data-driven insights. As a result, companies may place products in suboptimal locations, leading to reduced visibility, missed revenue opportunities, and inefficient promotional spending.

From the business analyst's perspective, although large volumes of data are available (including price, competitor price, foot traffic, promotions, and demographics), the absence of an interactive and centralized visualization system makes it hard to uncover meaningful patterns and relationships.

Real-Time Issues Identified

Issue	Current Situation	Business Impact
Lack of visualization	Data stored in raw Excel sheets	Hard to identify trends
Poor placement decisions	Products placed based on assumptions	Reduced sales potential
Limited customer insight	Demographics not analyzed properly	Ineffective targeting
No interactive filtering	Static reports only	Slow decision-making
Difficulty comparing prices	Competitor analysis not visualized	Weak pricing strategy

The root cause of the issue is the lack of a structured, interactive analytics platform that transforms raw retail data into actionable insights.

To address this, we propose developing an interactive Tableau-based Product Placement Analysis Dashboard that visualizes sales performance across different product positions, categories, seasons, and customer segments. This solution will enable businesses to make data-driven decisions, optimize product visibility, and improve overall revenue performance.
