

Project Design Phase

Proposed Solution

Date	15 February 2026
Team ID	LTVIP2026TMIDS36203
Project Name	Strategic Product Placement Analysis: Unveiling Sales Impact with Tableau Visualization
Maximum Marks	2 Marks

Proposed Solution:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Retail businesses often struggle with fragmented and scattered sales data stored in multiple files or systems. Managers rely on manual Excel reports, making it difficult to analyze product placement effectiveness, identify sales trends, and make timely strategic decisions. This results in delayed insights, poor inventory planning, and missed revenue opportunities.
2.	Idea / Solution Description	The solution is an interactive data visualization system built using Tableau dashboards integrated into a centralized platform. The dashboard consolidates sales data into a single, structured interface with filters, charts, and performance metrics. It enables users to analyze product placement impact, compare categories, track trends, and generate actionable insights efficiently.
3.	Novelty / Uniqueness	Unlike traditional static Excel reports, this solution provides dynamic, real-time visual analytics with interactive filters and drill-down capabilities. Users can instantly explore different product categories, regions, or time periods. The integration of Tableau dashboards within a web-based environment ensures accessibility, automation, and enhanced analytical capabilities beyond basic reporting.

4.	Social Impact / Customer Satisfaction	The solution enhances decision-making for retail managers, leading to better product placement strategies and improved customer shopping experiences. By identifying top-performing and underperforming products, businesses can optimize store layouts and inventory planning. This ultimately increases customer satisfaction, sales performance, and operational efficiency.
5.	Business Model (Revenue Model)	Although the system is primarily an analytical support tool, it directly contributes to revenue growth by identifying profitable product placements and reducing losses from poor-performing items. It improves business profitability through data-driven decision-making and optimized sales strategies.
6.	Scalability of the Solution	The solution is highly scalable and can be expanded to include additional datasets such as customer demographics, seasonal trends, inventory levels, or regional performance. It can be deployed across multiple retail branches and integrated with other business intelligence tools, making it adaptable for both small and large-scale enterprises.
